

RAND/USGS Planetary Geodesy (RUPG) Software

RANDLSQ Program Measurement Input format, for Lunar image measurements (with 7 character control point names).

File: RUPG-FMT5002.doc

Version: 2004.08.13

=====

File input:

Group 1 ("nmea" records):

Name	Columns	Format	Description (units)
Imageid	1-12	A12	Image identification. Usually flight data sequence (FSC) or similar image number (unitless).
Focallength	13-27	F15.5	Camera focal length (mm).
Pointid	30-36	2X,A7	Point identification (unitless).
X measure	37-51	F15.5	X measurement of point on image (mm).
Y measure	52-67	F15.5	Y measurement of point on image (mm).

Sample (from Clementine solution, zmea.dat):

=> 15730757 90.15000 Clerke -1.32251 1.00051<=

Notes:

1. "nmea" is the number of line/sample measurements of tie points. See the "Solution Parameterization" file (format RUPG-FMT5031.doc) for input of this.
2. A comment may appear after column 63 (e.g. a text comment or information on the pixel measurements).
3. Lines beginning with a "#" will eventually be treated as comments.
4. IMPORTANT: See format "RUPG-FMT5001.doc" for non-Lunar measurement files using 5 character Pointid.

=====

Reference: Model, program, and format generally follow that specified in:

Colvin, Tim R. (1992). "Photogrammetric Algorithms and Software for Spacecraft Optical Imaging Systems," _ A RAND NOTE _, N-3330-JPL.
